

SFP модуль предназначен для создания линии связи до 20км по одноволоконному одномодовому кабелю.

Особенности:

- SFP-WDM.1310-1490.20: 1310nm FP лазер / 1490nm фотоприемник
- SFP-WDM.1490-1310.20: 1490nm DFB лазер / 1310nm фотоприемник
- до 20 км
- SC разъем
- возможность горячей замены
- соответствие спецификации MSA SFP

Области применения:

- SONET/SDH Equipment Interconnect
- Fiber Channel Links
- WDM Gigabit Ethernet Links

Функциональное описание:

SFP-WDM.1310-1490.20 SFP модуль имеет лазер работающий на длине волны 1310нм, фотодиодный приемник на длину волны 1490нм, микросхемы для усиления и восстановления сигнала и микросхемы преобразования данных. SFP-WDM.1490-1310.20 SFP модуль имеет лазер работающий на длине волны 1490нм, фотодиодный приемник на длину волны 1310нм, микросхемы для усиления и восстановления сигнала и микросхемы преобразования данных. Модули имеют один SC разъем для оптического кабеля и 20-pin разъем для применения в устройствах связи. Модули позволяют осуществлять передачу данных в диапазоне 100Mbps-1,25Gbps.

Функциональная схема:

Absolute Maximum Ratings

Parameter	Symbol	Min.	Max.	Unit
Storage Temperature	T _s	-40	85	°C
Supply Voltage	V _{cc}	-0,5	3,6	V

Recommended Operating Conditions

Parameter	Symbol	Min.	Typical	Max.	Unit
Operating Temperature	T _A	0		70	°C
Power Supply Voltage	V _{CC}	3,15	3,3	3,45	V
Power Supply Current	I _{CC}			190	mA
Surge Current	I _{Surge}			30	mA
Baud Rate			1,25		GBaud
Total Supply Current	I _{CC}			300	mA
Surge Current	I _{Surge}			30	mA

PERFORMANCE SPECIFICATIONS - ELECTRICAL

Parameter	Symbol	Min.	Typ.	Max	Unit	Notes
TRANSMITTER						
CML/PECL Inputs(Differential)	V _{in}	400		2500	mVp	AC coupled inputs
Input Impedance (Differential)	Z _{in}	85	100	115	ohms	R _{in} > 100 kohms @ DC
Tx_DISABLE Input Voltage - High		2		3,45	V	
Tx_DISABLE Input Voltage - Low		0		0,8	V	
Tx_FAULT Output Voltage -- High		V _{cc} -0,5		V _{cc} +0,3	V	I _o = 400µA; Host V _{cc}
Tx_FAULT Output Voltage -- Low		0		0,5	V	I _o = -4.0mA
RECEIVER						
CML Outputs (Differential)	V _{out}	400	800	1200	mVpp	AC coupled outputs
Output Impedance (Differential)	Z _{out}	85	100	115	ohms	
Rx LOS Output Voltage - High		V _{cc} -0.5		V _{cc} +0.3	V	I _o = 400µA; Host V _{cc}
Rx LOS Output Voltage - Low		0		0.8	V	I _o = -4.0mA
MOD_DEF (0:2)	V _{oH}	2,5			V	With Serial ID
	V _{oL}	0		0,5	V

19	TD-	Inv. Transmit Data In	3	Note 8
20	VeeT	Transmitter Ground	1	Note 5

NOTE:

1) TX Fault is an open collector/drain output, which should be pulled up with a 4.7K –

10KΩ resistor on the host board. Pull up voltage between 2.0V and VccT, R+0.3V. When high, output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.

2) TX disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 4.7 – 10 K Ω resistor. Its states are:

Low (0 – 0.8V): Transmitter on

(>0.8, < 2.0V): Undefined

High (2.0 – 3.465V): Transmitter Disabled

Open: Transmitter Disabled

3) Mod-Def 0,1,2. These are the module definition pins. They should be pulled up with a 4.7K – 10KΩresistor on the host board. The pull-up voltage shall be VccT or VccR (see

Section IV for further details). Mod-Def 0 is grounded by the module to indicate that the module is present Mod-Def 1 is the clock line of two wire serial interface for serial ID Mod-

Def 2 is the data line of two wire serial interface for serial ID

4) LOS (Loss of Signal) is an open collector/drain output, which should be pulled up with a 4.7K – 10KΩ resistor. Pull up voltage between 2.0V and VccT, R+0.3V. When high, this output indicates the received optical power is below the worst-case receiver sensitivity (as defined by the standard in use). Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.

5) VeeR and VeeT may be internally connected within the SFP module.

6) RD-/+: These are the differential receiver outputs. They are AC coupled 100Ω differential lines which should be terminated with 100Ω (differential) at the user SERDES. The AC coupling is done inside the module and is thus not required on the host board. The voltage swing on these lines will be between 370 and 2000 mV differential (185 –1000 mV single ended) when properly terminated.

7) VccR and VccT are the receiver and transmitter power supplies. They are defined as 3.3V ±5% at the SFP connector pin. Maximum supply current is 300mA. Recommended host board power supply filtering is shown below. Inductors with DC resistance of less than 1 ohm should be used in order to maintain the required voltage at the SFP input pin with 3.3V supply voltage. When the recommended supply-filtering network is used, hot plugging of the SFP transceiver module will result in an inrush current of no more than 30mA greater than the steady state value. VccR and VccT may be internally connected within the SFP transceiver module.

8) TD-/+: These are the differential transmitter inputs. They are AC-coupled, differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the

module and is thus not required on the host board. The inputs will accept differential swings of 500 – 2400 mV (250 – 1200mV single-ended), though it is recommended that values between 500 and 1200 mV differential (250 – 600mV single-ended) be used for best EMI performance.

EEPROM:

The serial interface uses the 2-wire serial CMOS EEPROM protocol defined for the ATMEL AT24C02/04 family of components. When the serial protocol is activated, the host generates the serial clock signal (SCL). The positive edge clocks data into those segments of the EEPROM that are not write protected within the SFP transceiver. The negative edge clocks data from the SFP transceiver. The serial data signal (SDA) is bi-directional for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The memories are organized as a series of 8-bit data words that can be addressed individually or sequentially.

The Module provides diagnostic information about the present operating conditions. The transceiver generates this diagnostic data by digitization of internal analog signals. Calibration and alarm/warning threshold data is written during device manufacture. Received power monitoring, transmitted power monitoring, bias current monitoring, supply voltage monitoring and temperature monitoring all are implemented. The diagnostic data are raw A/D values and must be converted to real world units using calibration constants stored in EEPROM locations 56 – 95 at wire serial bus address A2h. The digital diagnostic memory map specific data field define as following .For detail EEPROM information, please refer to the related document of SFF 8472 Rev 9.3

2 wire address 1010000X (A0h)		2 wire address 1010001X (A2h)
