

**Особенности:**

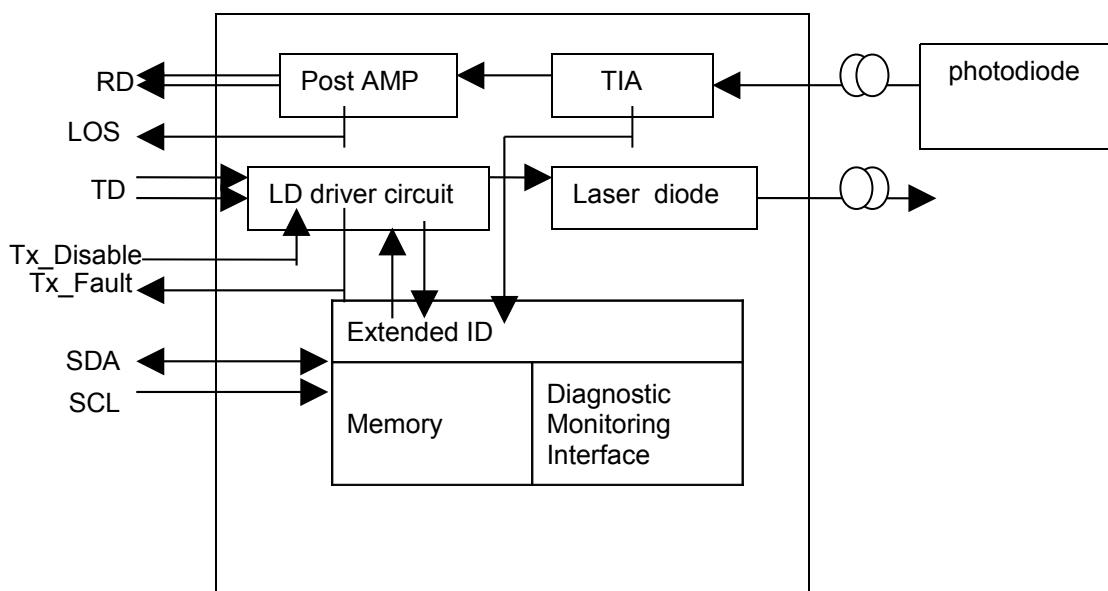

- Industrial: -40°C ~ +85°C
- 1310nm FP лазер + PIN фотоприемник
- возможность горячей замены
- LC разъем
- Digital diagnostic monitor interface (DDMI)
- соответствие спецификации SFP MSA и SFF-8472

**Области применения:**

- Gigabit Ethernet 10000Base-LX
- ATM
- SONET/SDH/PDH
- FDDI
- Fiber Channel

**Normal operating condition**

| Parameter                  | Symbol | Min  | Typ | Max  | Units | Ref.       |
|----------------------------|--------|------|-----|------|-------|------------|

| 19      | TD-         | Inv. Transmit Data In        | 3         | 8)                                 |
| 20      | VeeT        | Transmitter Ground           | 1         | 5)                                 |

1) TX Fault is an open collector/drain output, which should be pulled up with a  $4.7K - 10K\Omega$  resistor on the host board. Pull up voltage between 2.0V and VccT, R+0.3V. When high, output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.

2) TX disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a  $4.7 - 10 K\Omega$  resistor. Its states are:

Low (0 - 0.8V): Transmitter on

(>0.8, < 2.0V): Undefined

High (2.0 - 3.465V): Transmitter Disabled

Open: Transmitter Disabled

3) Modulation Absent, connected to VEET or VEER in the module.

4) LOS (Loss of Signal) is an open collector/drain output, which should be pulled up with a  $4.7K - 10K\Omega$  resistor. Pull up voltage between 2.0V and VccT, R+0.3V. When high, this output indicates the received optical power is below the worst-case receiver sensitivity (as defined by the standard in use). Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.

5) VeeR and VeeT may be internally connected within the SFP module.

6) RD-/+: These are the differential receiver outputs. They are AC coupled  $100\Omega$  differential lines which should be terminated with  $100\Omega$  (differential) at the user SERDES. The AC coupling is done inside the module and is thus not required on the host board.

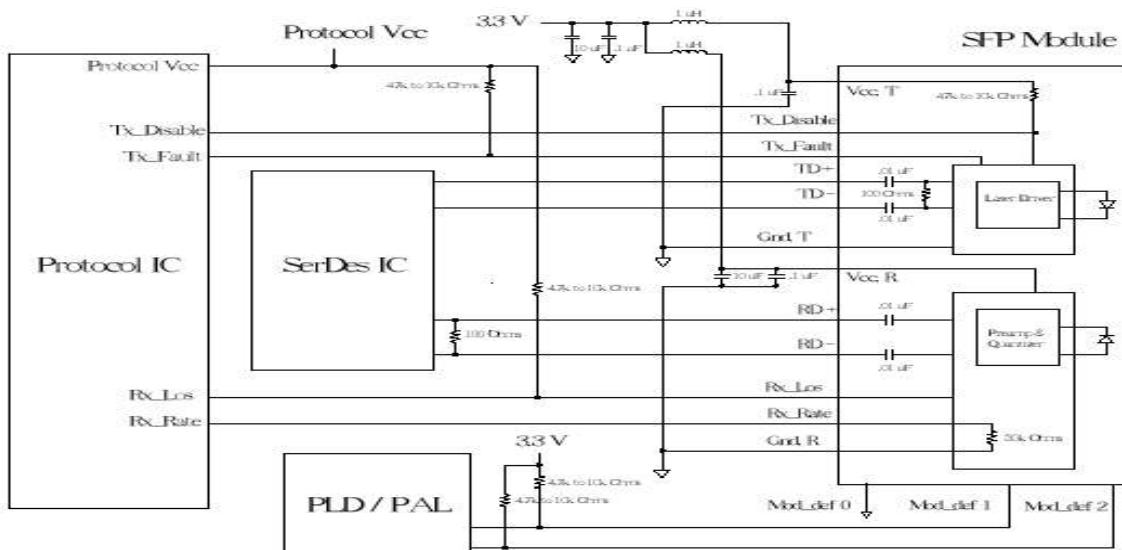

7) VccR and VccT are the receiver and transmitter power supplies. They are defined as  $3.3V \pm 5\%$  at the SFP connector pin. Maximum supply current is 300mA. Recommended host board power supply filtering is shown below. Inductors with DC resistance of less than 1 ohm should be used in order to maintain the required voltage at the SFP input pin with 3.3V supply voltage. When the recommended supply-filtering network is used, hot plugging of the SFP transceiver module will result in an inrush current of no more than 30mA greater than the steady state value. VccR and VccT may be internally connected within the SFP transceiver module.

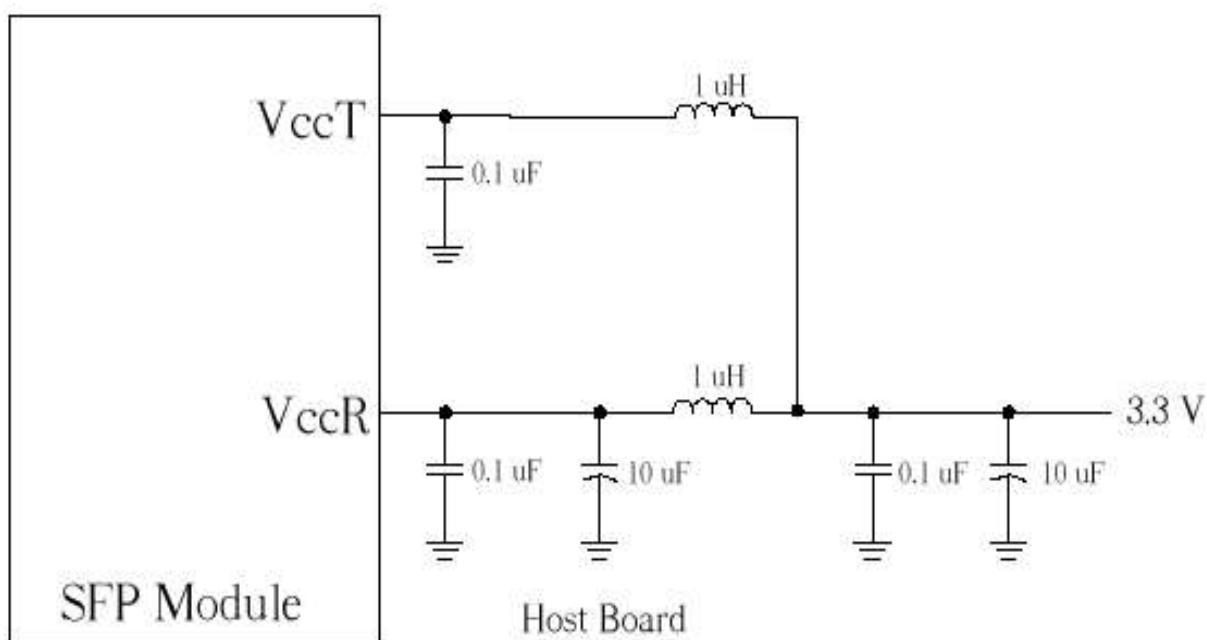

8) TD-/+: These are the differential transmitter inputs. They are AC-coupled, differential lines with  $100\Omega$  differential termination inside the module. The AC coupling is done inside the module and is thus not required on the host board.

The serial interface uses the 2-wire serial CMOS EEPROM protocol defined for the ATMEL AT24C02/04 family of components. When the serial protocol is activated, the host generates the serial clock signal (SCL). The positive edge clocks data into those segments of the EEPROM that are not write protected within the SFP transceiver. The negative edge clocks data from the SFP transceiver. The serial data signal (SDA) is bi-directional for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of

serial protocol activation. The memories are organized as a series of 8-bit data words that can be addressed individually or sequentially. The Module provides diagnostic information about the present operating conditions. The transceiver generates this diagnostic data by digitization of internal analog signals. Calibration and alarm/warning threshold data is written during device manufacture. Received power monitoring, transmitted power monitoring, bias current monitoring, supply voltage monitoring and temperature monitoring all are implemented. If the module is defined as external calibrated, the diagnostic data are raw A/D values and must be converted to real world units using calibration constants stored in EEPROM locations 56 – 95 at wire serial bus address A2H. The digital diagnostic memory map specific data field define as following .For detail EEPROM information, please refer to the related document of SFF 8472 Rev 9.3.

#### Рекомендованная схема включения:

**Описание контактов (PIN):**

| Pin Name    | PIN           | Name/Function   |
|-------------|---------------|---|
| GNDR        | 9, 10, 11, 14 | Receiver Ground   |
| VCCR        | 15            | Receiver Supply Voltage. They are defined as $+3.3V \pm 5\%$ at the SFP connector pin. Recommended host board power supply filtering is shown below. The DC resistance of inductor is less than $1\Omega$ , which result in maintaining the required voltage at the SFP input pin with $+3.3V$ supply voltage.  |
| RD-         | 12            | Receiver Data, Differential Output. They are AC coupled $100\Omega$ differential lines which should be terminated with $100\Omega$ at the user SERDES. The AC coupling is done inside the module and is thus not required on the host board. The voltage swing on these lines will be between 370mV and 2000mV differential when properly terminated. |
| RD+         | 13            | Receiver Data, Differential Output. They are AC coupled $100\Omega$ differential lines which should be terminated with $100\Omega$ at the user SERDES. The AC coupling is done inside the module and is thus not required on the host board. The voltage swing on these lines will be between 370mV and 2000mV differential when properly terminated. |
| LOS         | 8             | Receiver Loss of Signal, logic high, open collector compatible, 4.7K to 10K Ohm pull up to VCCR on host   |
| Rate Select | 7             | NC.   |
| GNDT        | 1, 17, 20     | Transmitter Ground  |
| VCCT        | 16            | Transmitter Supply Voltage. They are defined as $+3.3V \pm 5\%$ at the SFP connector pin. Recommended host board power supply filtering is shown below. The DC resistance of inductor is less than $1\Omega$ , which result in maintaining the required voltage at the SFP input pin with $+3.3V$ supply voltage.                                     |
| TD+         | 18            | Transmit Data, Differential Input. They are AC coupled $100\Omega$ differential   |

|            |    |  |
|------------|----|--|
|            |    | lines which should be terminated with 100Ω inside the module. The AC coupling is done inside the module and is thus not required on the host board.  |
| TD-        | 19 | Transmit Data, Differential Input. They are AC coupled 100Ω differential lines which should be terminated with 100Ω inside the module. The AC coupling is done inside the module and is thus not required on the host board. |
| TX_Disable | 3  | Transmitter Disable, logic high, open collector compatible, 4.7K to 10K Ohm pull up to VCCT on SFP. The pin is used to shut down the transmitter optical output. High is transmitter Disabled, Low is transmitter on.        |
| TX_Fault   | 2  | Transmitter Fault, logic high, open collector compatible, 4.7K to 10K Ohm pull up to VCCT on host. When high, output indicates a laser fault of some kind. Low indicates normal operation.                                   |
| MOD_DEF_0  | 6  | SFP module definition and presence, bit 0, 4.7K to 10K Ohm pull up to VCCT on host. The pin is grounded by the module to indicate that the module is present.  |
| MOD_DEF_1  | 5  | SFP module definition and presence, bit 1, 4.7K to 10K Ohm pull up to VCCT on host. The pin is the clock line of two wire serial interface for serial ID   |
| MOD_DEF_2  | 4  | SFP module definition and presence, bit 2, 4.7K to 10K Ohm pull up to VCCT on host. The pin is the data line of two wire serial interface for serial ID.   |

#### Описание EEPROM:

WDM SFP модуль содержит EEPROM. Это обеспечивает доступ к информации о идентификации, которая описывает способности модуля, стандарты интерфейса, наименование производителя и код модели. Последовательный интерфейс использует 2-х проводной последовательный CMOS EEPROM протокол, определенный для ATTEL AT24C01A/02/04 семейства микросхем. Когда последовательный протокол активирован, Host производит последовательный сигнал Clock (SCL MOD\_DEF1). Положительный сигнал clock data позволяет выбрать сегмент не защищенного от записи EEPROM в пределах памяти SFP модуля. Отрицательный сигнал позволяет считывать данные с SFP модуля. Последовательный сигнал данных (SDA MOD\_DEF2) двунаправленный для последовательного протокола. Организация памяти – последовательные 8-и битовые слова, которые могут быть адресованы индивидуально или последовательно.

#### Mechanical Specifications
